4th Step: Bathymetric Color-Coding

Bathymetric Color Coding

The grid has been colored using Bathymetric color coding. The parameters like shininess,thickness,power,smooth,linear, and sea level are been introduced.

Shininess: This parameter shows the lower regions brightly.
Thickness:Grid with convenient height can be viewed using thickness parameter to see the features.
Power:By adjusting the power, we can get the compressed layers of height.
smooth:This parameter helps us to see the grid in interpolation and non-interpolation mode.
Linear: This parameter is used in seeing the heights with equal spacing.
Sealevel: This parameter helps us in adjusting the sea-level.
